

ARCUSAFLEX®

Highly flexible rubber disc coupling for internal combustion engine drives

www.reich-kupplungen.com

SIMPLY **POWERFUL.**

D2C – Designed to Customer

The guiding principle of Designed to Customer is the recipe for success behind REICH. In addition to the catalogue products, we supply our customers with couplings developed to their specific requirements. The designs are mainly based on modular components to provide effective and efficient customer solutions. The special nature of our close cooperation with our partners ranges from; consulting, development, design, manufacture and integration to existing environments, to customer-specific production, logistics concepts and after-sales service - worldwide.

This customer-oriented concept applies to both standard products and production in small batch sizes.

The company policy at REICH embraces, first and foremost, principles such as customer satisfaction, flexibility, quality, prompt delivery and adaptability to the requirements of our customers.

REICH supplies not only a coupling, but a solution:

Designed to Customer – and that is **SIMPLY POWERFUL.**

ARCUSAFLEX®

General Technical Description

ARCUSAFLEX®

Highly flexible, axially pluggable flange coupling

The ARCUSAFLEX® coupling (abbreviation: AC) is a highly torsionally flexible flange coupling with an axial plug-in facility, providing a torsionally soft connection between an internal combustion engine and a driven machine. The highly flexible torque transmission characteristic is achieved by a disc-shaped rubber element that is subjected to a torsional load and enables both the absorption of high torsional vibrations and the compensation of major misalignments. Various vulcanisates are available to achieve optimum adaptation to the given application conditions: a natural/synthetic caoutchouc mixture is the standard version for application temperatures of up to 80 °C, more heat resistant mixtures for up to 100 °C/120 °C and a silicone mixture for higher application temperatures up to 130 °C.

The inside diameter of the rubber element is vulcanized directly to a hub body or bolt-on sleeve. The toothed profile on the circumference of the element provides a virtually backlash-free, positive plug-in connection to the coupling flange when in service.

The ARCUSAFLEX® flange coupling series covers a torque range from 210 Nm to 72 000 Nm.

Element versions of different dynamic torsional stiffnesses are available for optimizing the torsional vibration range. The flange connection dimensions of ARCUSAFLEX® couplings comply predominantly with the SAE J 620 and DIN 6281 standards. Other flange dimensions or overall lengths can be provided on request.

Shaft-to-shaft connections when required can be met by ARCUSAFLEX® shaft couplings which consist of an ARCUSAFLEX® flange coupling of the standard type equipped with a second hub. Type approvals from a number of leading classification societies have been obtained. If required, couplings complete with a fail-safe device can also be supplied.

ARCUSAFLEX® couplings comply with ATEX explosion protection. They are certified according to Directive 2014/34/EU and may be used in explosive environments (categories 2 + 3). ATEX documentation to supplement the operating instructions is available on request.

ARCUSAFLEX®

Nominal torques from 210 Nm to 72 000 Nm

ARCUSAFLEX®

Advantages and uses

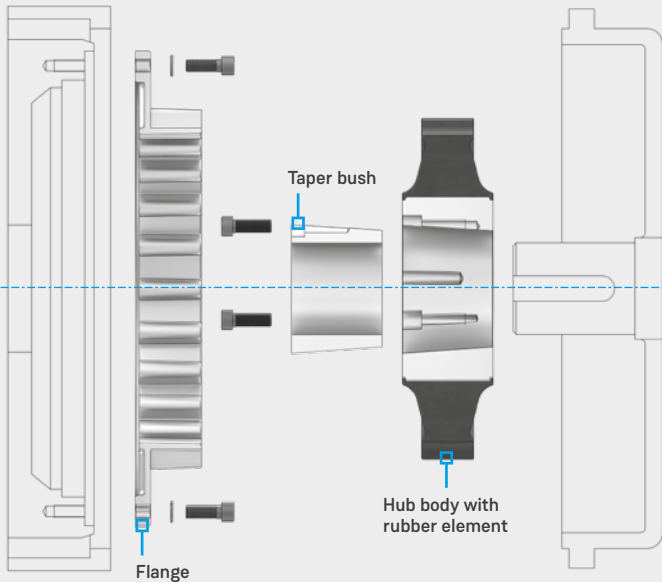

Key features and benefits of the ARCUSAFLEX®-coupling:

→ Very high torsional elasticity with a linear torsional deflection characteristic	→ The selection of different shore hardnesses enables optimum torsional vibration tuning and the shifting of resonances into non-critical operating ranges → System reliability and durability
→ High torsional vibration and shock load damping capability	→ Drive train protection for lower lifecycle costs (LCC)
→ Adaptability to operating conditions, various vulcanizates for ambient temperatures up to 130 °C	→ Global use possible under the toughest conditions
→ Elastomer teeth may slip in the event of an overload	→ Protecting connected components maximises productivity
→ Due to cam gearing on the rubber element and in the coupling flange, almost backlash-free, positive torque transmission	→ Protection against damage to other drive train components. No shocks during load switching or load direction reversal. Smooth running
→ Axial plugability with large axial float. Cam gearing engages with coupling flange. Compensation of positioning inaccuracies	→ Fast installation and repair times resulting in high economic efficiency
→ Compensation of misalignments and easy positioning of the drive and output side are enabled	→ Little assembly effort. Cost savings due to fast work processing
→ Extended range of application due to ATEX certification in accordance with Directive 2014/34/EU 	→ Use also possible in explosive atmosphere with corresponding safety requirements

ARCUSAFLEX®

Standard Types

Type AC-T...F2

Flange coupling with taper bush

The ARCUSAFLEX® flange coupling type AC-T...F2 is equipped with a taper bush for shaft mounting. The rubber element is vulcanized directly to the hub body of the taper bush. After completion of the assembly, a shrink-fit-like connection, free from backlash is established between the coupling hub with rubber element and the shaft.

Thanks to the use of commercially available taper bushes with a number of different bore dimensions, the need for finishing the bore and keyway of the coupling hub is omitted for the ARCUSAFLEX® coupling type AC-T...F2. The torque, which can be transmitted, depends on the particular taper bush.

+ Advantage: Ease of assembly and disassembly with no need for special tools!

Type AC...F2

Flange coupling with hub

The ARCUSAFLEX® flange coupling type AC...F2 has the rubber element vulcanized to a bolt-on sleeve which in turn is bolted to a hub or similar component.

+ Advantage: Depending on the arrangement of the rubber element, two different mounting lengths can be achieved using one and the same coupling hub.

Type AC...F2K

Flange coupling for radial element change

Type AC...F2K allows the detached element to be replaced without moving the coupled machines, provided that the shaft of the driven machine does not protrude from the coupling hub. Where the flywheel or flywheel housing protrudes excessively from the element, a spacer ring corresponding to oversize X is required for radial removal.

+ Advantage: Changing element without having to move the coupled machines possible!

Flange coupling

with hub and two coupling elements operating in tandem.

Type AC...D F2

Shaft coupling

Coupling element and separable flange hub with taper bush.

Type AC-T...T

Shaft coupling

with two hubs and two coupling elements operating in tandem.

Type AC...D TK

Flange coupling

with fail-safe device (get-you-home-device), to be mounted between an internal combustion engine and a marine gearbox.

Type AC...F2 DS

Flange coupling with splined taper bush

to be mounted between an internal combustion engine and a pump drive.

Type AC...F2
with splined taper bush

Flange coupling with external flange housing and integrated electromagnetic coupling

to disconnect the drive.

Type AC...F2
with electromagnetic coupling

Shore hardness Sh A, Resonance factor V_R and relative damping ψ

Element version	Sh A	V_R	ψ
WN	55	7.85	0.80
NN	65	5.46	1.15
SN	75	5.03	1.25
UN	85	4.83	1.30

i Due to the physical properties of the rubber material, the measurable rubber hardness is subject to a variation that is defined as $\pm 5^\circ$ Shore a according to DIN 53505. However, this variation is minimized by our own rubber production.

General Technical Information

The technical data applies only to the complete coupling or the corresponding coupling elements. It is the customer's/user's responsibility to ensure there are no inadmissible loads acting on any of the components. In particular, existing connections, e.g. bolted connections, must be checked with regard to the torques to be transmitted. If necessary, further measures, such as additional reinforcement with pins, may be necessary. It is the customer/user's responsibility to make sure that the dimensioning of the

shaft and key and/or other connection, e.g. shrinking or clamping connection, is correct. All components that can rust are protected against corrosion as standard.

REICH have an extensive range of couplings and coupling systems to cover nearly every drive configuration. Customized solutions can be developed and manufactured even in small batches or as prototypes. In addition calculation programs are available for all necessary dimensioning.

Additional information for selection of couplings with silicone elements

$$1,6 - 2,0 T_{AN} \leq T_{KN}$$

T_{AN} = nominal torque of the drive

T_{Kmax1} is the highest permissible maximum torque of the application taking into account for example starting, stopping with resonance crossing.

T_{Kmax2} is the highest permissible peak torque which can occur with a limited number of application related conditions, e.g. short-circuit, synchronization failure, emergency stop.

Shore hardness Sh A, Resonance factor V_R and relative damping ψ

Element version	Sh A	V_R	ψ
WX	60	5.46	1.15

i Due to the physical properties of the rubber material, the measurable rubber hardness is subject to a variation that is defined as $\pm 5^\circ$ Shore a according to DIN 53505. However, this variation is minimized by our own rubber production.

ARCUSAFLEX®

Materials

Coupling flanges:

Coupling size AC 2.3 to AC 10.2D, AC 11D and AC 11.9 made of high grade cast aluminium
Coupling size AC 7.5 and AC 11 to AC 12D made of cast iron with spheroidal graphite

For type AC with hub:

Bolt-on sleeve of cast iron with spheroidal graphite, hub of steel (min. yield strength 360 MPa)

For type AC-T:

Hub body and taper bush of cast iron with lamellar graphite

Material Overview

Rubber mixture	Ambient temperature	Colour	Identifier
Natural / synthetic caoutchouc, standard version	-40 °C to +80 °C	black	...N
Natural/synthetic caoutchouc in temperature-resistant design	-25 °C to +100 °C	black	...T
Synthetic caoutchouc in temperature-resistant design*)	-25 °C to +120 °C	black	...Y
Silicone caoutchouc	-40 °C to +130 °C	blue	...X

ARCUSAFLEX®

Selection of the coupling size

The coupling size, for use in combustion engines, is designed and selected with a view to torsional vibration. For preliminary selection using the engine torque T_{AN} a general safety factor of $S = 1.3 - 1.5$ should be applied for ARCUSAFLEX® couplings with flexible disc elements of natural/synthetic caoutchouc.

In selecting the coupling size the following should be satisfied:

 The **nominal torque of the coupling** T_{KN} must be taken into account at every temperature and operating load of the coupling while observing the service factors S (e.g: temperature factor S_t) shall be at least equal to the maximum nominal torque on the drive side T_{AN} ; the temperature in the immediate vicinity of the coupling must be taken into account.

$$T_{KN} \geq T_{AN} \cdot S_t$$

 The **nominal torque on the drive side** T_{AN} is calculated with the driving power P_{AN} and the coupling speed n_{AN} .

$$T_{AN} [Nm] = 9550 \frac{P_{AN} [kW]}{n_{AN} [min^{-1}]}$$

 The **temperature factor** S_t allows for the decreasing load capacity of the coupling when affected by elevated ambient temperatures in the vicinity of the coupling. In this connection $S_t = S_{t1}$ is valid for standard version and $S_t = S_{t2}$ for silicone version.

Temperature t	60 °C	70 °C	80 °C	90 °C	100 °C	110 °C	120 °C	130 °C
S_{t1}	1.25	1.4	1.6	On request	-	-	-	-
S_{t2}	1.5	1.5	1.5	1.7	1.9	2.1	2.3	2.5

 The **maximum torque capacity of the coupling**, T_{Kmax} shall be at least equal to the highest torque T_{max} encountered in operation while taking the temperature factor S_t into account.

$$T_{Kmax} \geq T_{max} \cdot S_t$$

 A continuous torsional vibration analysis to verify the coupling selection should confirm that the permissible **continuous fatigue torque** T_{KW} is at least equal to the highest fatigue torque T_W under reversing stresses encountered throughout the operating speed range while taking into account the temperature and frequency.

$$T_{KW} (10 \text{ Hz}) \geq T_W \cdot S_t \cdot S_f$$

 The **frequency factor** S_f allows for the frequency dependence of the permissible continuous fatigue torque under reversing stresses $T_{KW} (10 \text{ Hz})$ with an operating frequency f_x .

$$S_f = \sqrt{\frac{f_x}{10}}$$

The selection of the coupling size should be checked with regard to the permissible coupling load, in particular any fatigue torques occurring, by means of a torsional vibration analysis, which we carry out on request (if all necessary technical data is available) according to the two-mass or n-mass system. When using ARCUSAFLEX® couplings in drives with high torque transmission variations, an additional safety factor should

be applied for torque transmission to the driven machine. The coupling can be equipped with an additional balancing mass on the primary or secondary side, if this is required due to the torsional vibration conditions or for control reasons. Further information for the torsional vibration analysis and for use of the ARCUSAFLEX® rubber disc coupling are available on request.

ARCUSAFLEX®

Type AC-T...F2

Fig. 1

Fig. 2

Mounting instruction:

If engine and generator connecting dimensions comply with DIN 6281, the distance dimension L_X must be observed during assembly. The coupling dimension L_F must be within the tolerance.

Available taper bushes

TB-No.

D = metric bores with keyway acc. to DIN 6885/1

Coupling size	Element version according to "General Technical Data"	Version for element changing	Flange connection size acc.to SAE J 620 (AC 12: D ₁)	Mounting length L _F in mm
AC 10.2D	.NN.	F2K.	21.	350

Coupling designation: AC 10.2D .NN. F2K. 21. 350

ARCUSAFLEX®

Permissible shaft displacement

The permissibility of major shaft displacements depends on a number of factors such as coupling size, shore hardness of the element, operating speed and torque load of the coupling. The reference values listed below refer to an operating speed of $\approx 1500 \text{ min}^{-1}$. Precise alignment prevents premature wear of the rubber element. Observe the operating instructions.

Technical specifications

Coupling size		1.5	2.3	2.6	3	4 4.1	4.9	5 5.1	6 6.1	6.5	7	7.5	8 8D	9 9D	10 10D	11 / 11D 11,7 / 11,7D 11.9	12 12D
Max. permissible axial displacement *)	ΔK_a [mm]	±2.5	±3	±4	±7	+16/-6	±7	±5	±7	±4	±10	±7	±5	±4	±3	±4	±3
Max. permissible radial displacement	ΔK_r [mm]	0.8	1.2	1.2	1.2	1.2	1.2	1.2	1.3	1.3	1.3	1.3	1.4	1.5	1.5	1.5	1.5
Max. permissible angular displacement	α [°]	0.5°	0.5°	0.5°	0.5°	0.5°	0.5°	0.5°	0.4°	0.4°	0.4°	0.4°	0.4°	0.4°	0.3°	0.3°	0.3°

i *) For types AC...F2K and AC...TK the axial fitting length L_F of the coupling should always offer a plus tolerance within the possible tolerance range in order to reach max. axial movability of the dismantled coupling element.

i Larger displacements of short duration, as may occur when starting and stopping the diesel engine, are permissible. These maximum displacements must not occur simultaneously.

Data required for coupling size selection

General

1. Project: _____
2. Application (combined heat and power unit, emergency power generator, fire pump, ...): _____
3. Operating mode (continuous operation, emergency power operation, ...): _____
4. Place of operation/location: _____ Ambient temperature: T_U _____ [°C]
5. Certification/class/requisite rules for selecting the coupling size: _____

Engine side

1. Engine (manufacturer, designation/type): _____ Diesel Gas
2. Engine power (nominal operation): P _____ [kW]
3. Engine speed (nominal speed): n _____ [min⁻¹]
4. Idling speed available? yes no
If adjustable from: n _____ [min⁻¹] to _____ [min⁻¹]
5. If variable speed operation, speed range from: n _____ [min⁻¹] to _____ [min⁻¹]
! Please attach corresponding speed/torque/power diagram.
6. Total stroke volume: V_H _____ [ccm] R/V (angle): _____ Number of cylinders: _____
7. Moments of inertia engine incl. damper without flywheel: J _____ [kgm²]
Moments of inertia flywheel: J _____ [kgm²]
Total moments of inertia of the engine (incl. damper, flywheel, etc.): J _____ [kgm²]

Output side

1. Type (generator, pump transfer case, pump, compressor, ...): _____
2. Type (manufacturer, designation): _____
3. Moments of inertia: J _____ [kgm²]
4. Connection dimensions (D x L, toothed shaft (standard), flange, ...): _____
! For branched systems: System sketch with details of the individual inertias (with details of the reference speed) and transmission ratios.

If the prime mover is to be flange-mounted to the engine with an intermediate housing, we require the following to determine an optimum mounting position; specified details and dimensions as in the following sketch:

ARCUSAFLEX®

Notes

A large grid of graph paper for taking notes, consisting of 30 columns and 40 rows of small squares.

ARCUSAFLEX®

SIMPLY POWERFUL. ————— □

Industrial solutions:

- ⚡ Power generation
- 🚛 Mobile applications
- 💡 Test benches
- ⚙️ PUMPS & COMPRESSORS
- ⚙️ Industry

March 2022 edition

The present ARCUSAFLEX® catalogue edition renders parts of the previous ARCUSAFLEX® catalogues obsolete. All dimensions are given in millimetres. We reserve the right to change dimensions and/or design without prior notice. Texts and illustrations, dimensional and performance data have been compiled with the utmost care. There is no guarantee, however, that the information is accurate; in particular, there is no guarantee that products will match the illustrations in terms of technology, colour, shape and configuration or that the products will correspond to the proportions of the illustrations. We also reserve the right to make changes due to printing errors or mistakes.
