Weight

Standard-Install Shield Board Installation standard Flight Controller orientation

Installation inverted Flight Controller

Custom-Install Shield Board

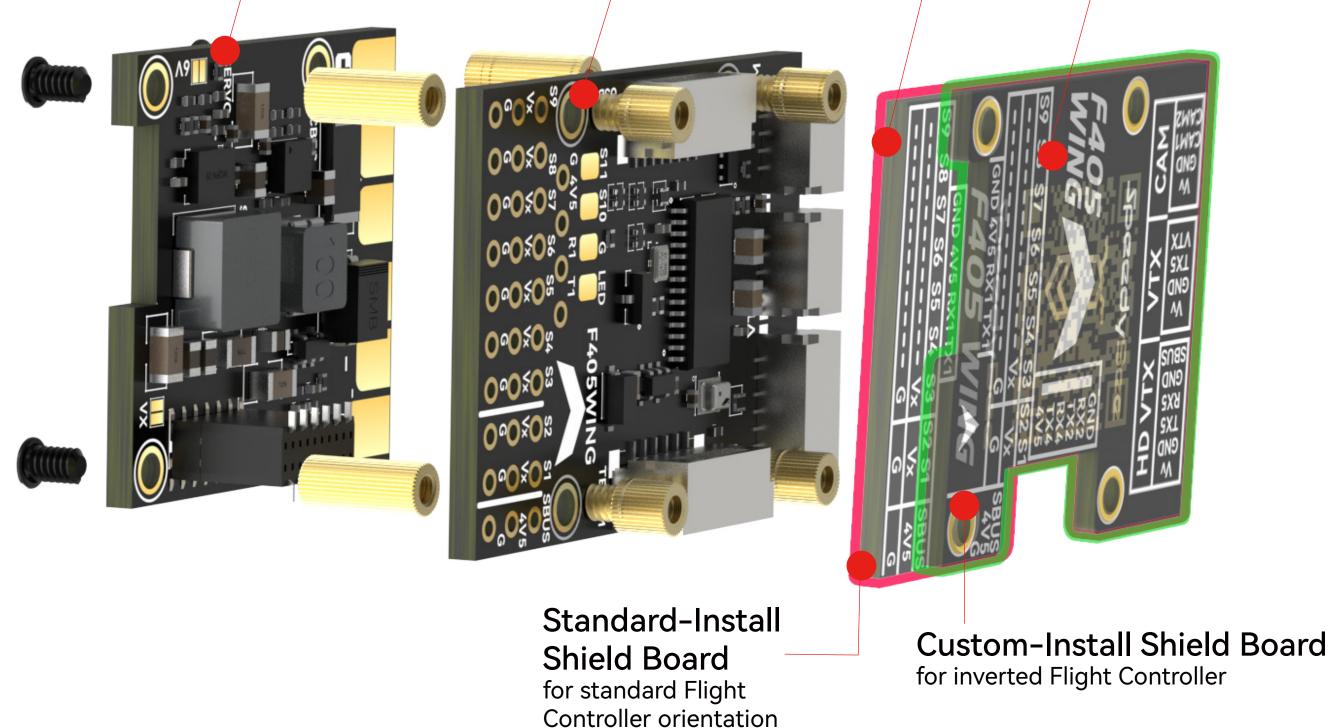

1.Assemble (PDB Board) and (FC Board), align pins, insert,

and secure with screws and bolts.

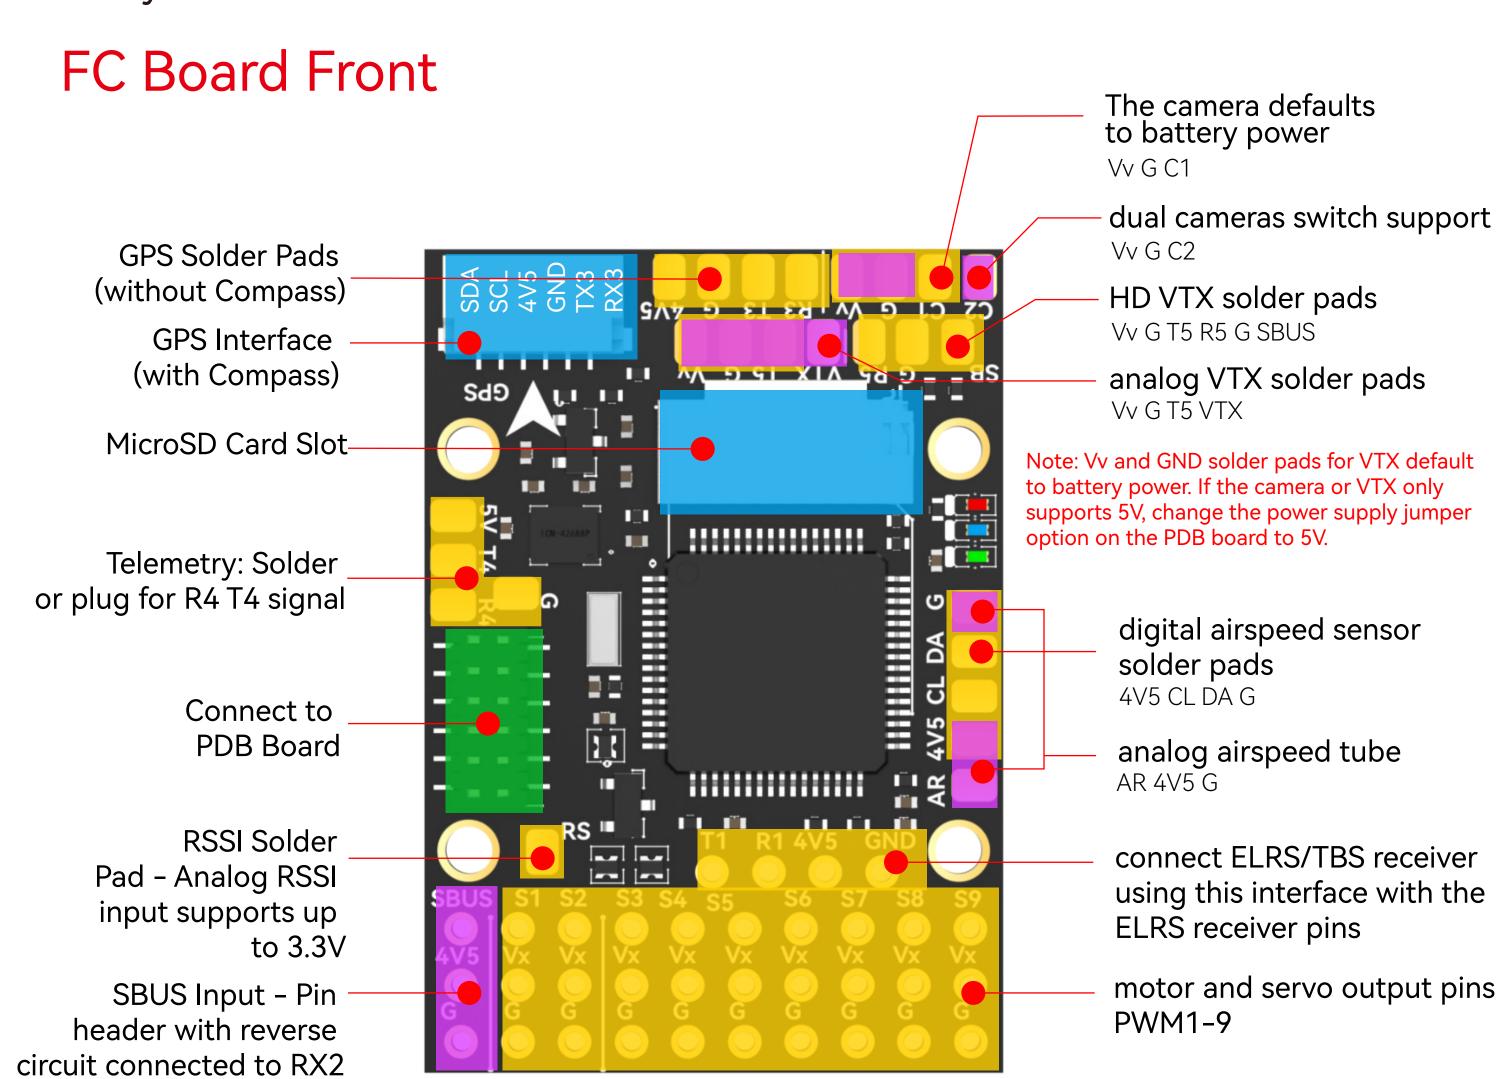

- 2.For standard Flight Controller orientation, assemble (Standard-Install Shield Board).
 - 0 **D**

3.For inverted Flight Controller, assemble (Custom-Install Shield Board).

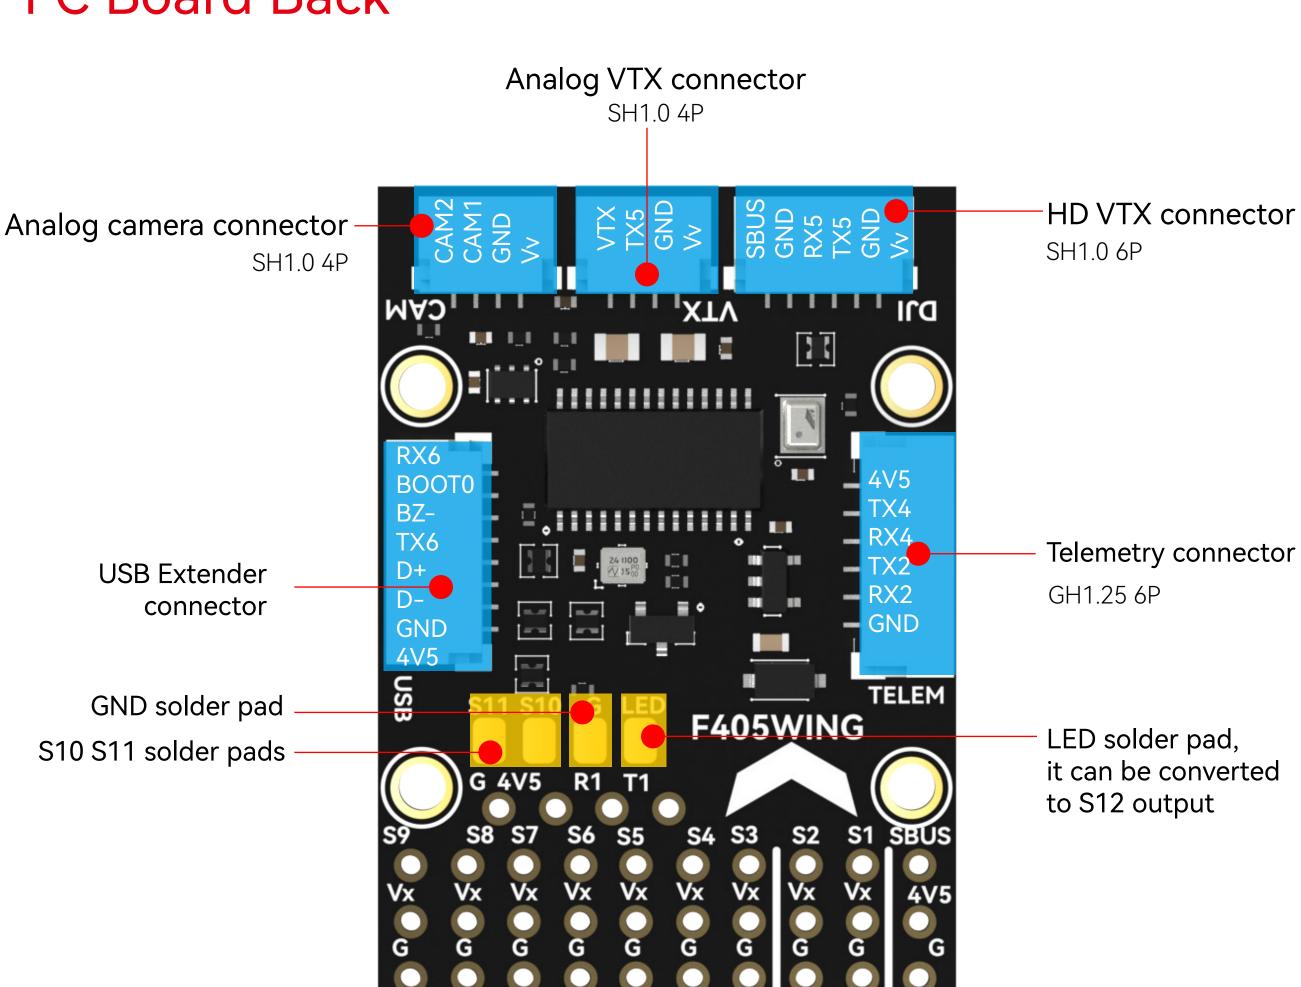

Part2-Hardware Description

Layout

FC Board Back

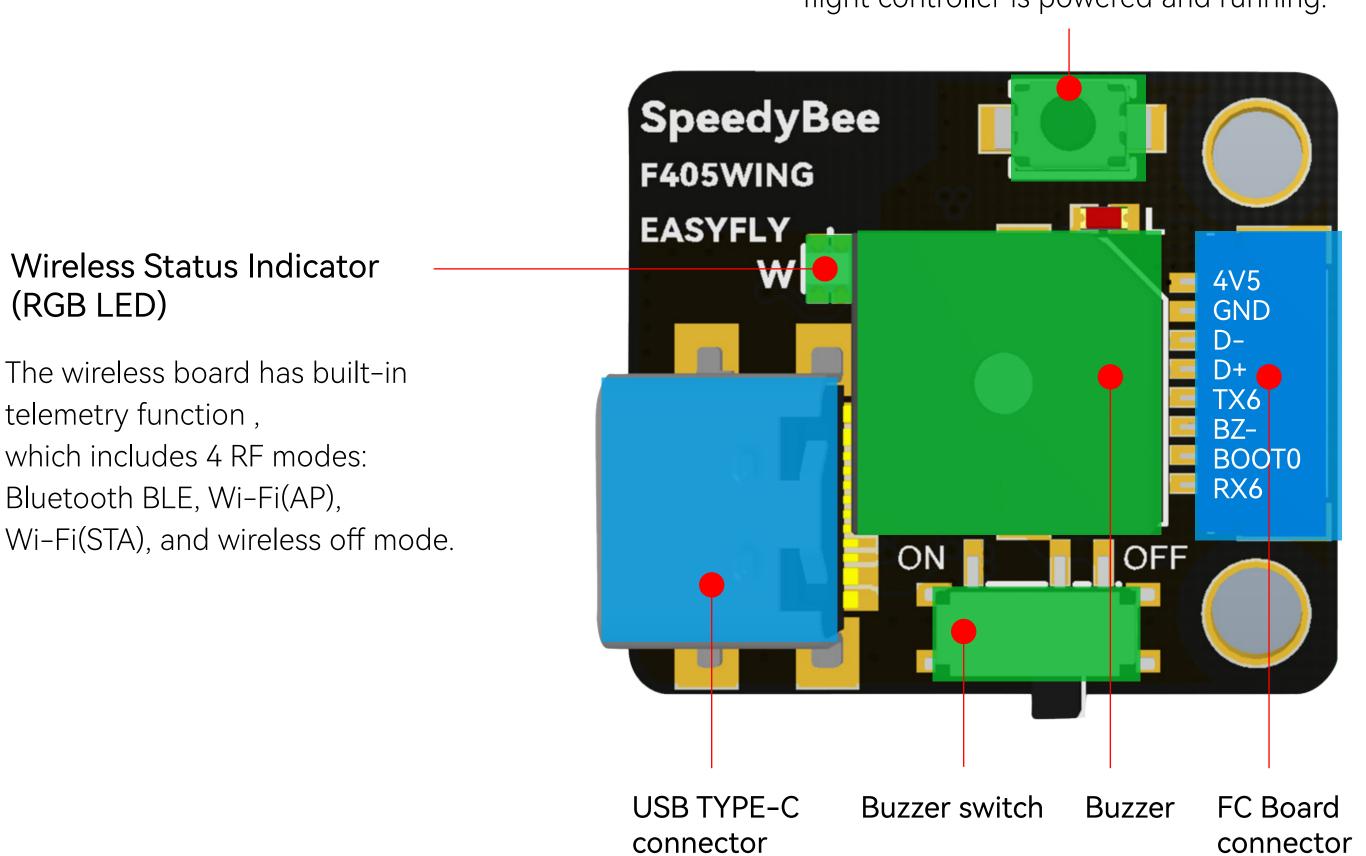

USB Extender Front

BOOT Button

Hold BOOT button while powering on to enter DFU mode to flash the firmware.

Note that the BOOT button serves other functions when the flight controller is powered and running.

Green Slow Flash: Bluetooth BLE not connected Solid Green: Bluetooth BLE connected

White Slow Flash: Wi-Fi (AP) not connected

Solid White: Wi-Fi (AP) connected

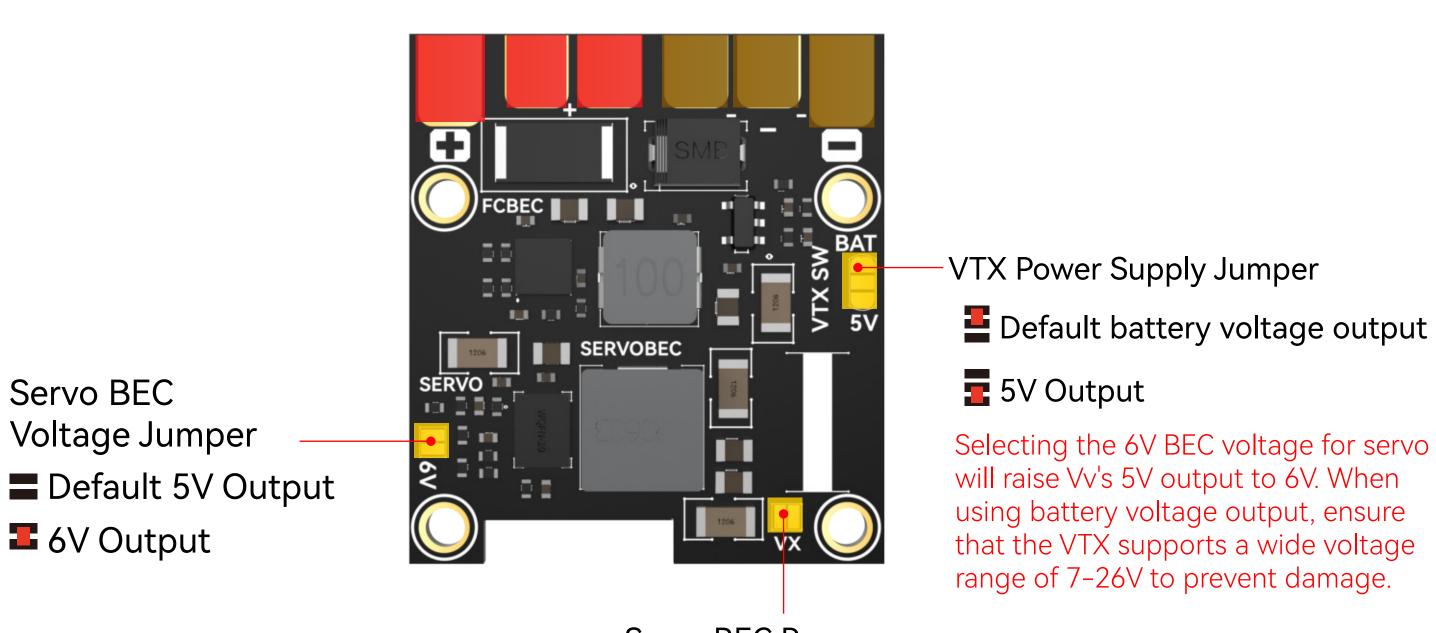

Purple Slow Flash: Wi-Fi (STA) not connected

Solid Purple: Wi-Fi (STA) connected

RGB LED off: Wireless off.

Press BOOT button for 6 seconds to switch between 4 wireless modes. When the yellow LED flashes rapidly and the device automatically restarts, the switch is successful.

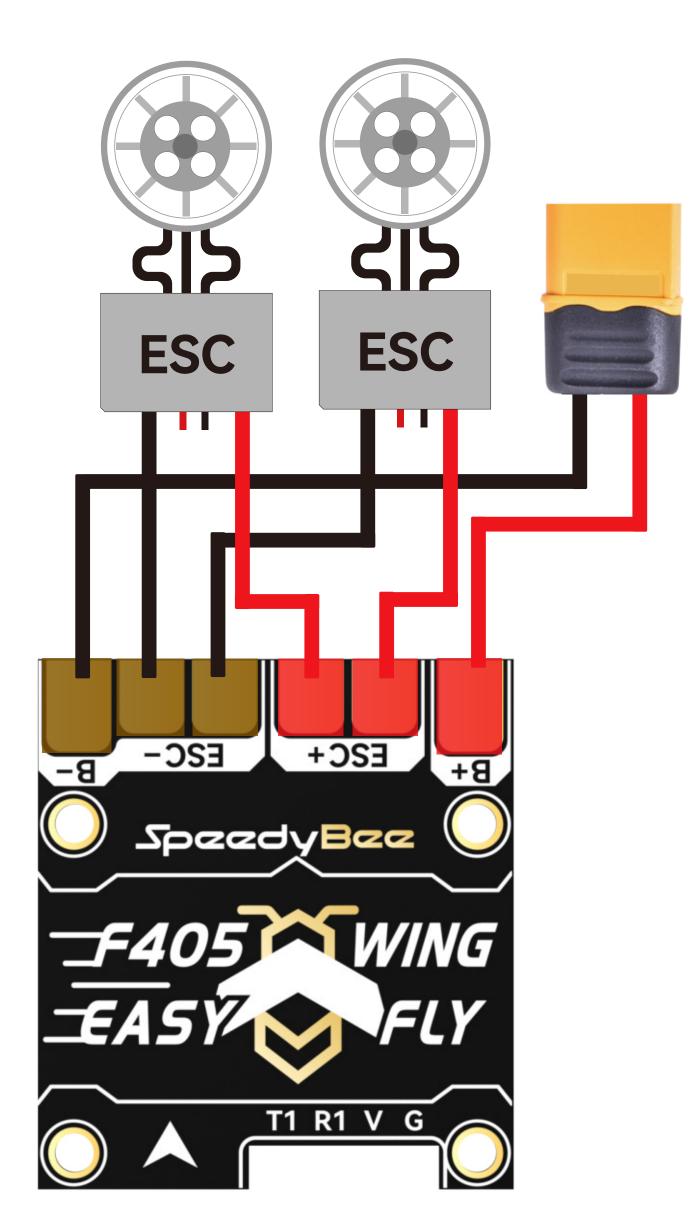

PDB Board Back

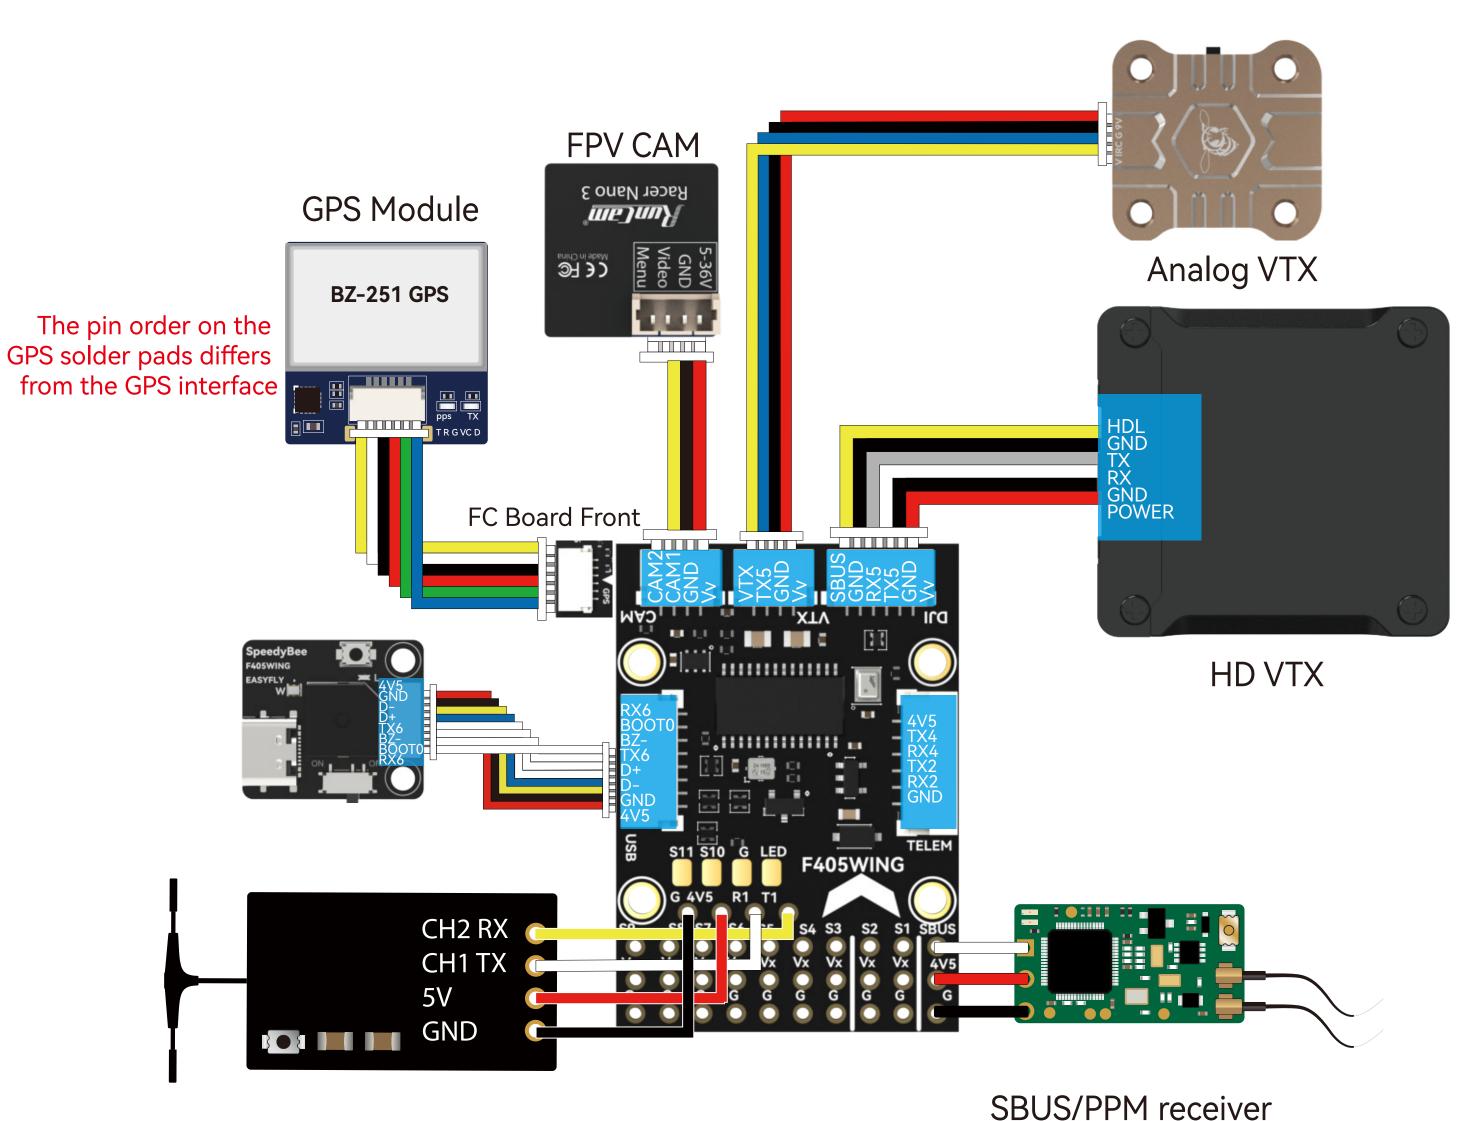

Servo BEC Power Supply Jumper

- Default servo BEC power supply
- **E**SC BEC power supply

PDB Board Front

- Peripheral Connection on FC Board
- Method 1, Plug and Play

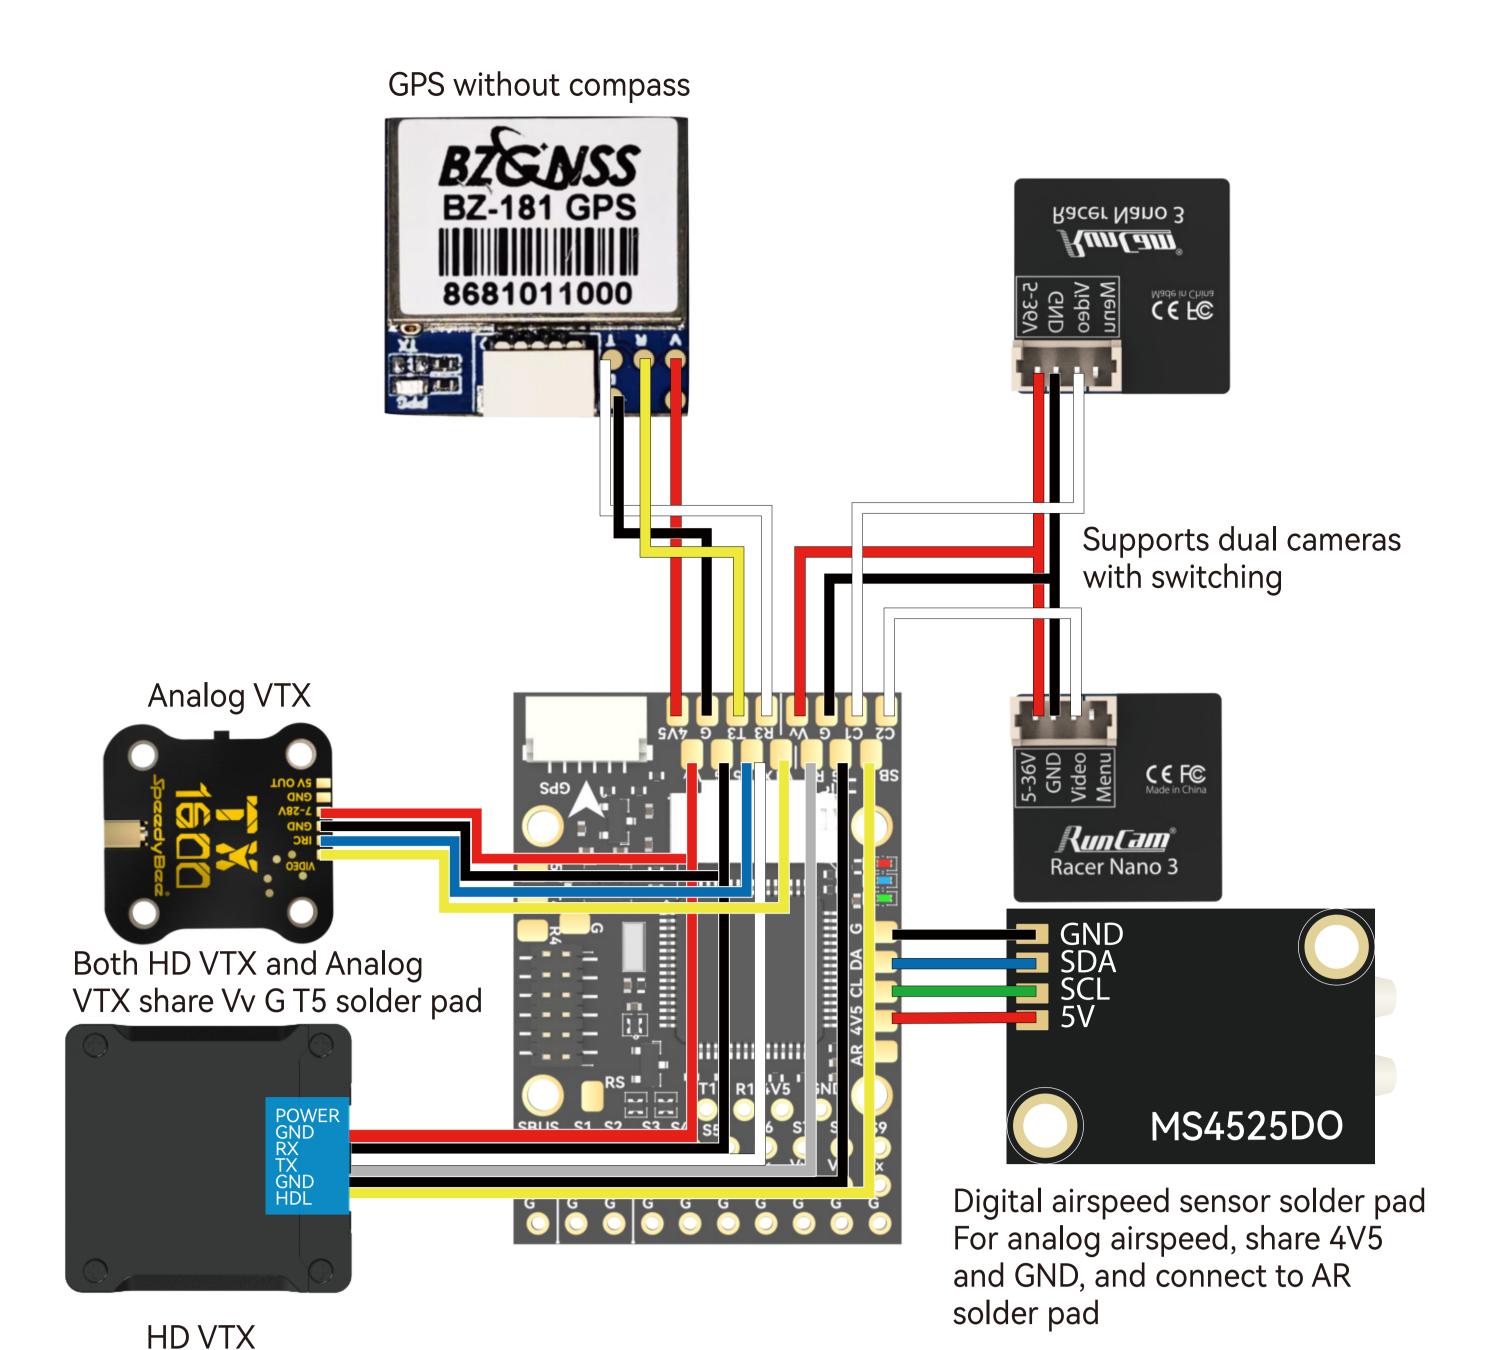

ELRS/TBS receiver
Use a 4-pin Dupont female header on the FC Board front.

Use a 3-pin Dupont female header on the FC Board front.

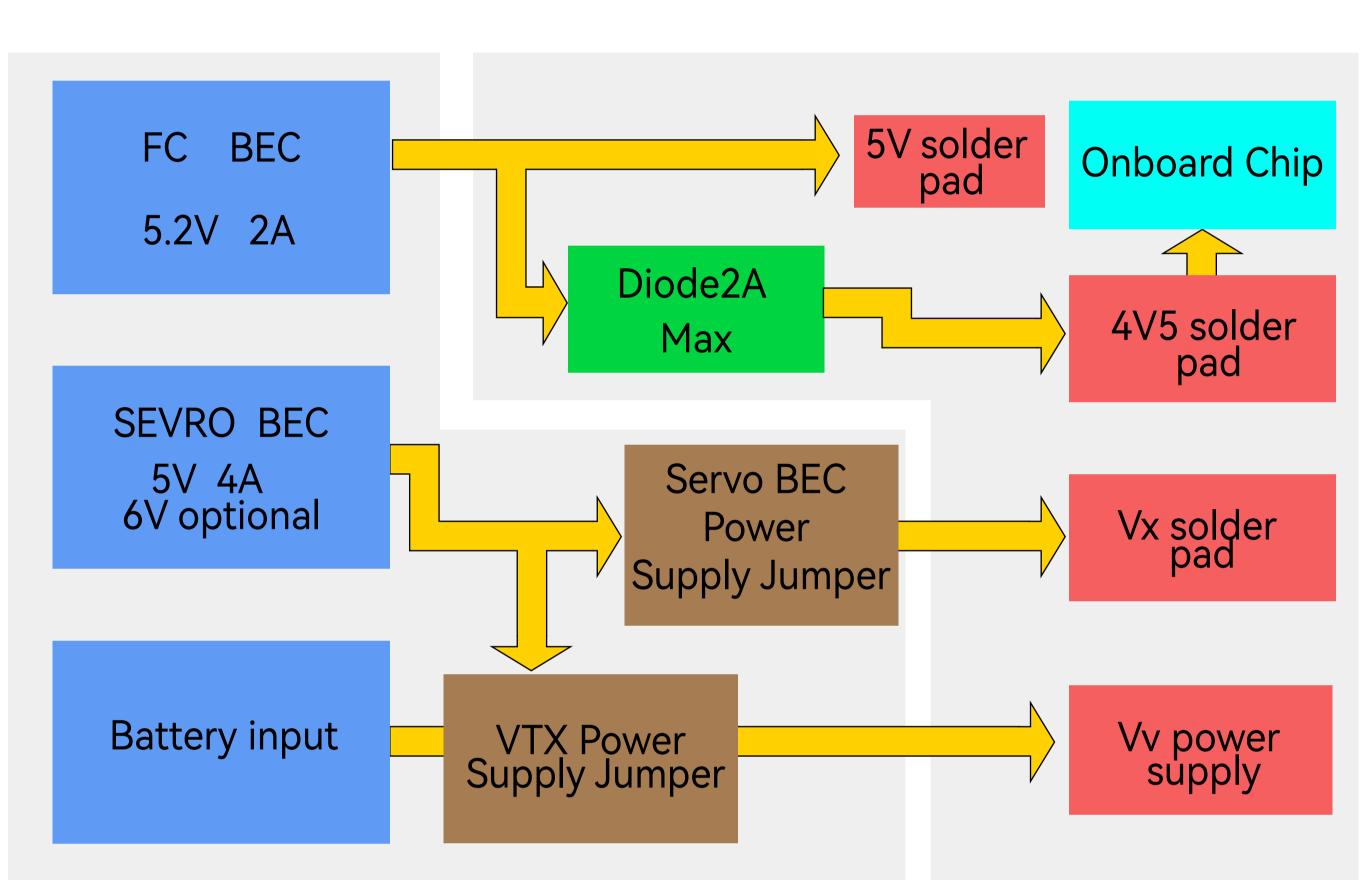

Method 2, Soldering

FC Front

Power Supply

The layout for the F405 WING MINI is as follows

FC Board

- 1, FC BEC default output is 5.2V, supplied in two routes:
- The second route is supplied through a diode to the onboard chip and the

The first route is directly supplied to the 5V solder pads.

PDB Board

4V5 solder pads. Please note that FC BEC can provide 2A continuous current and 3A peak cur-

rent. The onboard chip requires power ≤ 1A, GPS and receiver ≤ 0.1A, and wireless controller ≤ 0.1A. If connecting high-power telemetry or VTX to the 5V solder pads, ensure the operating current is $\leq 0.8A$.

battery power or internal BEC 5V (shared with 5V4A Servo BEC). Factory setting is battery power, where Vv interface voltage is the same as

2, The VTX power supply interface (Vv) can be set to two power ways: direct

the battery voltage. Please note: Ensure the voltage of VTX and camera power supply matches the battery voltage, if not, damage may occur.

• By using VTX Power Supply Jumper, you can switch to 5V power supply. In this case, the Vv interface voltage will be 5V (if you choose this method, ensure

the servo and VTX current are sufficient). Please note: When Servo BEC Voltage Jumper is switched to 6V, the Vv interface voltage also switches to 6V.

3, Servo power supply (Vx pin header) defaults to being powered by Servo

BEC at 5V. When Servo BEC is switched to 6V via Servo BEC Voltage Jumper, the voltage at the Vx pin header also switches to 6V.

Please note that if the ESC supports BEC output, do not connect the BEC red

wire to the Vx pin header. Otherwise, it may damage the ESC or Servo BEC.

Alternatively, you can directly power it using the ESC's BEC, but you need to disconnect Servo BEC Power Supply Jumper. In this way, the power supply for the Vx pin header comes from an ESC's BEC.

- 4, Power supply recommendations:
- When using a digital VTX with a wide voltage input, you can use the default
- battery voltage for Vv. When using an analog VTX powered by 5V, you can switch Vv power supply
- voltage to Servo BEC's 5V supply. In this case, you can install up to four 9g servos to avoid insufficient current. When using aircraft with 64 or 70 EDF Jets, Servo BEC power supply may not

be sufficient for servos and landing gear. You can disconnect Servo BEC Power

Supply Jumper and directly use the ESC's BEC to power the devices.

Part 3 - Firmware Upgrade and APP Connection

Firmware Upgrade

SpeedyBee F405 WING MINI does not support wireless firmware flashing. Please update the firmware using a computer by following these steps:

1) Press and hold the BOOT button while connecting the FC to your computer via a USB cable.

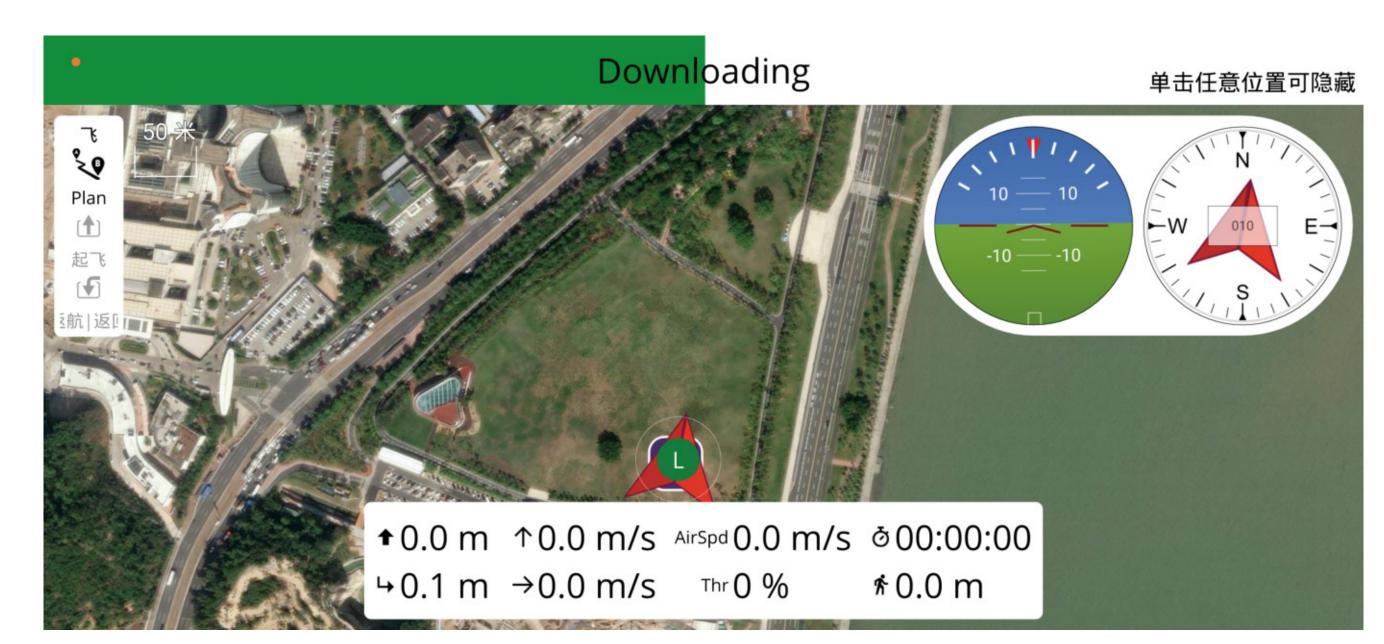

2)Open the INAV Configurator on your computer and navigate to the "Firmware Flasher" page. Select the flight controller target as "SPEEDYBEEF405WING" and proceed with flashing the firmware.

③To flash ArduPilot firmware, follow the same steps as above. Select "Load Firmware [local]" and proceed with flashing the firmware.

APP Connection

Connecting ArduPilot firmware to QGroundControl app

Check the color of the Wireless Status Indicator. If it's not White Slow Flash, press the BOOT button for 6 seconds to switch to White. Then connect to the "SpeedyBee eFLY-WIFI", and open QGroundControl, it will be automatically connected.

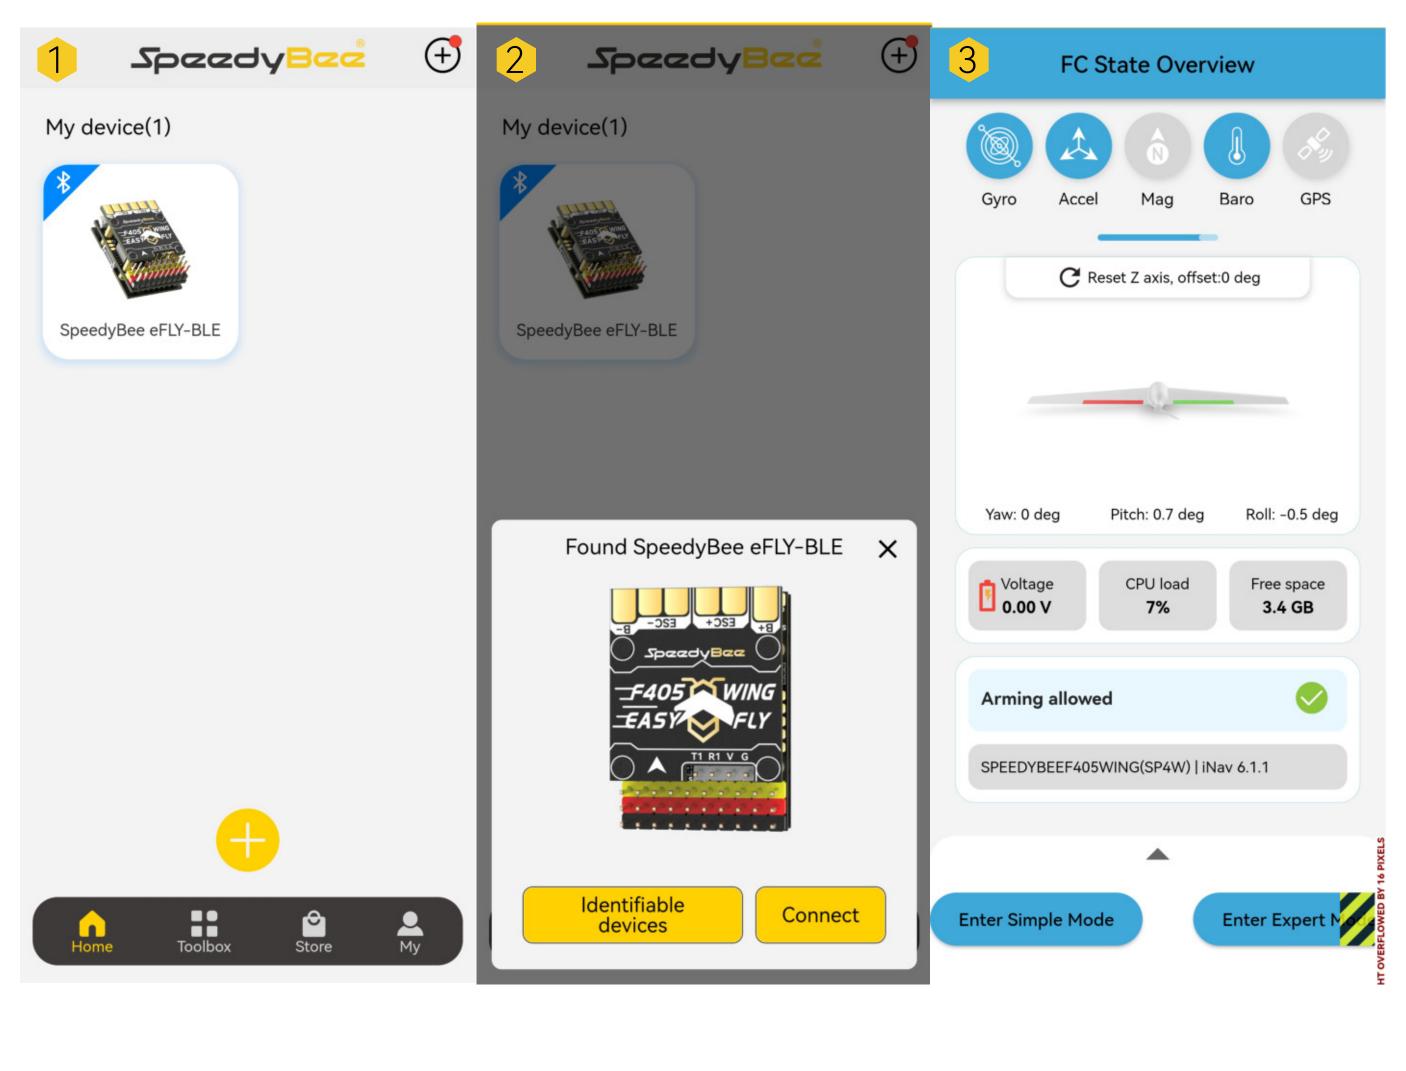

APP Connection

Recommend:

Check the color of the Wireless Status Indicator. If it is Green Slow Flash, open the

Connecting INAV firmware to SpeedyBee APP

SpeedyBee App and follow the steps to connect to the corresponding product.

WiFi mode for ArduPilot firmware. WiFi(AP) WiFi(STA) Bluetooth BLE

latest versions)

Weight

Supported FC Firmware

Barometer	SPL006-001
OSD Chip	AT7456E
Blackbox	MicroSD Card Slot
UART	6 sets (USART1, USART2, USART3, UART4, UART5, UART6 - Dedicated for Wireless board Telemetry connection)
I2C	1x Used for magnetometer, digital airspeed sensor
ADC	4x (VBAT, Current, Analog RSSI, Analog AirSpeed)
PWM	12x (9x pin headers + 2x solder pads + 1x "LED" pad)
ELRS/CRSF Receiver	Supported, connected to UART1
SBUS	Built-in inverter for SBUS input (UART2-RX)
LED	3x LEDs for FC STATUS (Blue, Green) and 3.3V indicator (Red)
Analog RSSI	Supported, Named as "RS"
Dual Analog Camera Switching (Supported in INAV 7.0 and	Default to Camera1 Video Input (C1). Switch between C1 and C2 using ArduPilot Relay or INAV Modes/USER.

INAV: SpeedyBeeF405WING (default)

ArduPilot: SpeedyBeeF405WING

5.6g

Both cameras should have the same video format, either PAL or NTSC.

SpeedyBee F405 WING MINI PDB board

Product Name	SpeedyBee F405 WING MINI PDB board
Input voltage range	7~26V (2~6S LiPo)
Battery Voltage Sensor	Connect to FC board VBAT, 1K:10K (Scale 1100 in INAV, BATT_VOLT_MULT 11.0 in ArduPilot)
Battery Current Sensor	80A continuous, 150A peak Connect to FC board Current (Scale 195 in INAV, 50 A/V in ArduPilot)
TVS Protective diode	Yes
FC BEC output	Output 5.2V +/- 0.1V DC Continuous current 2 Amps, 3A Peak Designed for FC, Receiver, GPS module, AirSpeed Sensor, Telemetry module
VTX & Camera power supply	The VTX power interface Vv offers two power supply options: direct battery voltage or integrated BEC 5V (sharing the 5V4A Servo BEC voltage) By default, it is set to battery voltage (Ensure the VTX and camera input voltage range is compatible) Switching to 5V power supply is possible via pad jumper (using Servo BEC output) (If using this method, ensure the current requirements for both servo and VTX are sufficient)
Servo BEC output	Output 5V +/- 0.1V DC Continuous current 4 Amps, 5A Peak Voltage adjustable, 5V Default, 6V via jumper Designed for Servos.

Part6-Standard settings

- FC Inverted Settings
- Hardware Installation

According to the diagram in Part 1, if you choose to install the FC in the standard Flight Controller orientation, you can use the default parameters.

If you choose to install the FC inverted (with the PDB board facing the ground and the Custom-Install Shield Board facing the sky), you will need to make the following settings.

① On the CLI page, enter the following commands in the input box:

INAV Settings

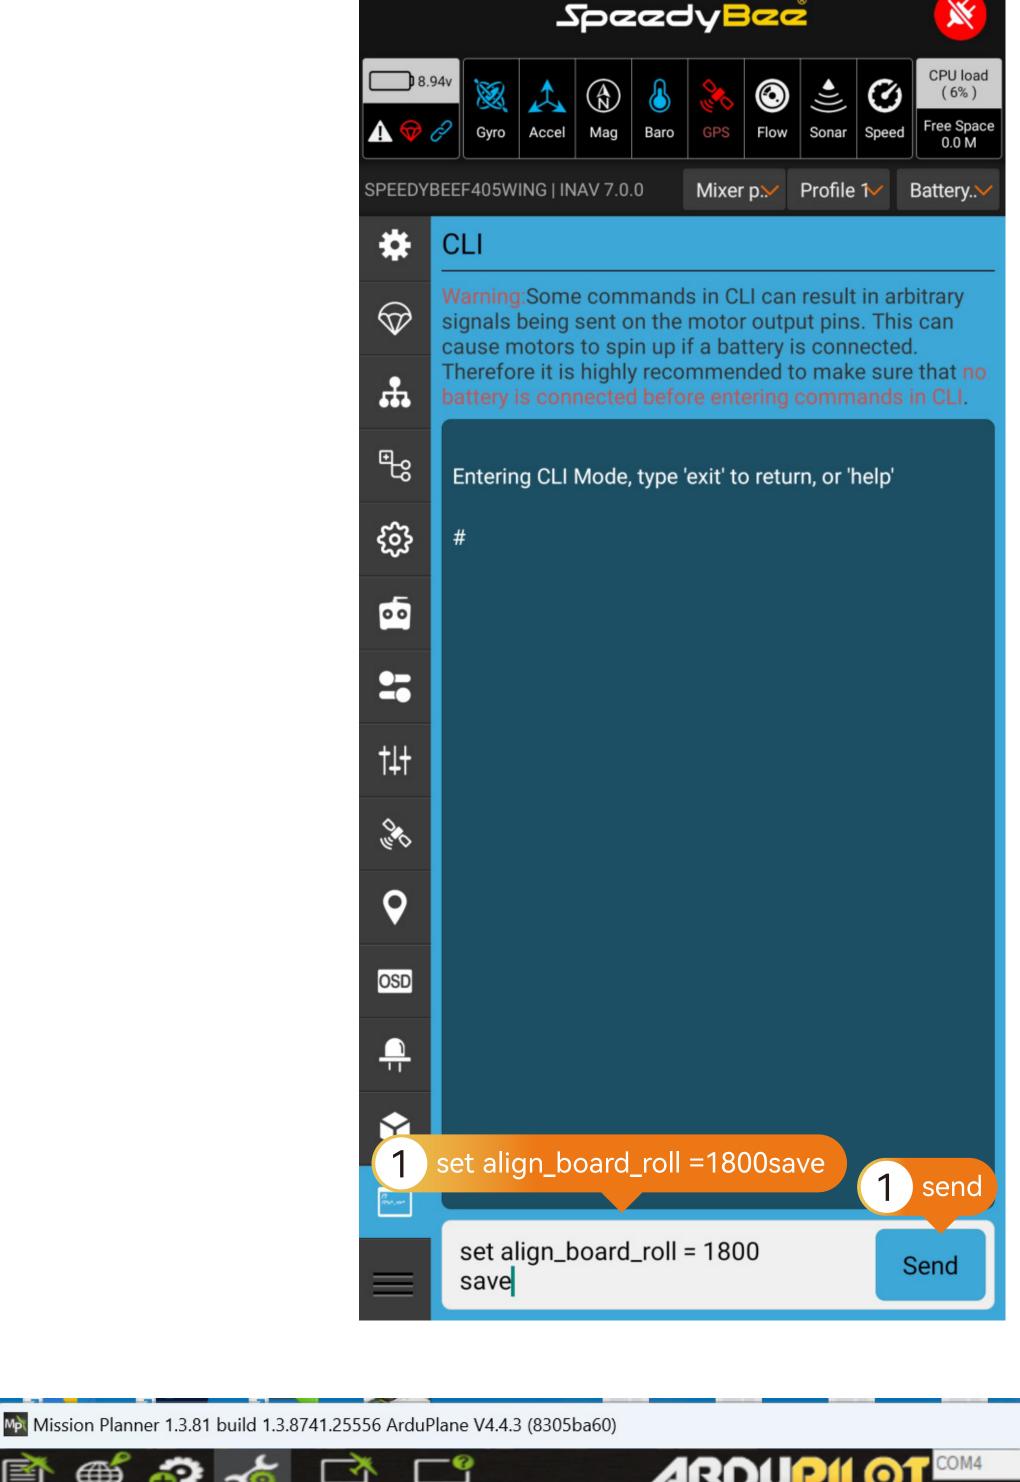

set align_board_roll = 1800 save ②Click "Send," and the FC will save the parameters and restart.

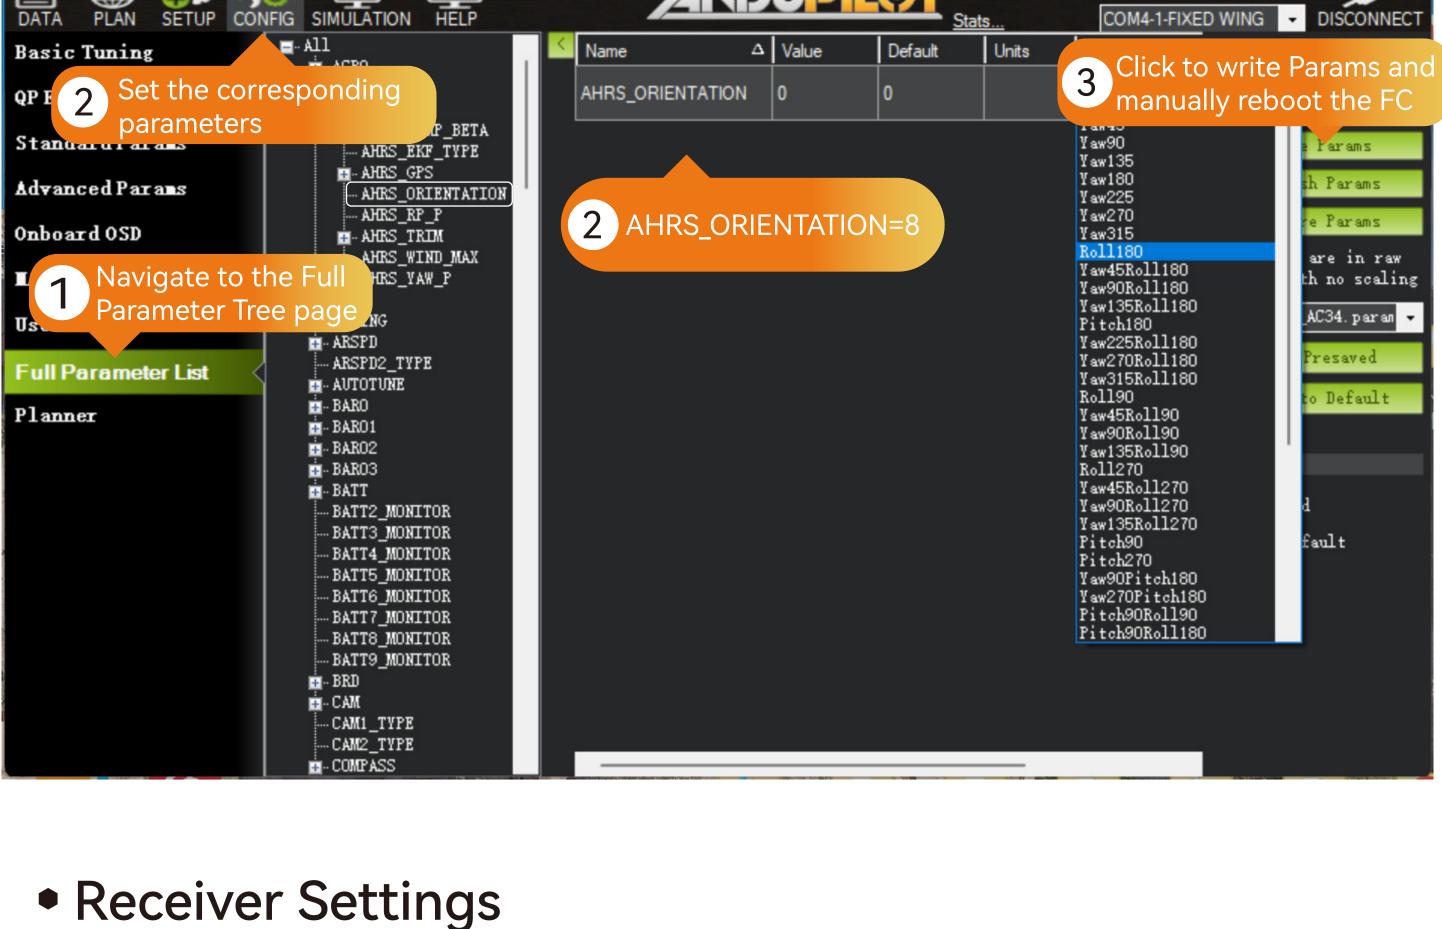

ArduPilot Settings

Go to the parameter settings in MissionPlanner, Set the parameter

AHRS_ORIENTATION=8 (Option is Roll180), and manually restart.

PPM Receiver:

Hardware Connection:

Use a 3-pin Dupont male-to-male cable and plug it into the SBUS input pin header.

PPM receivers only supported in INAV 3.x and below.

INAV Settings

INAV does not support

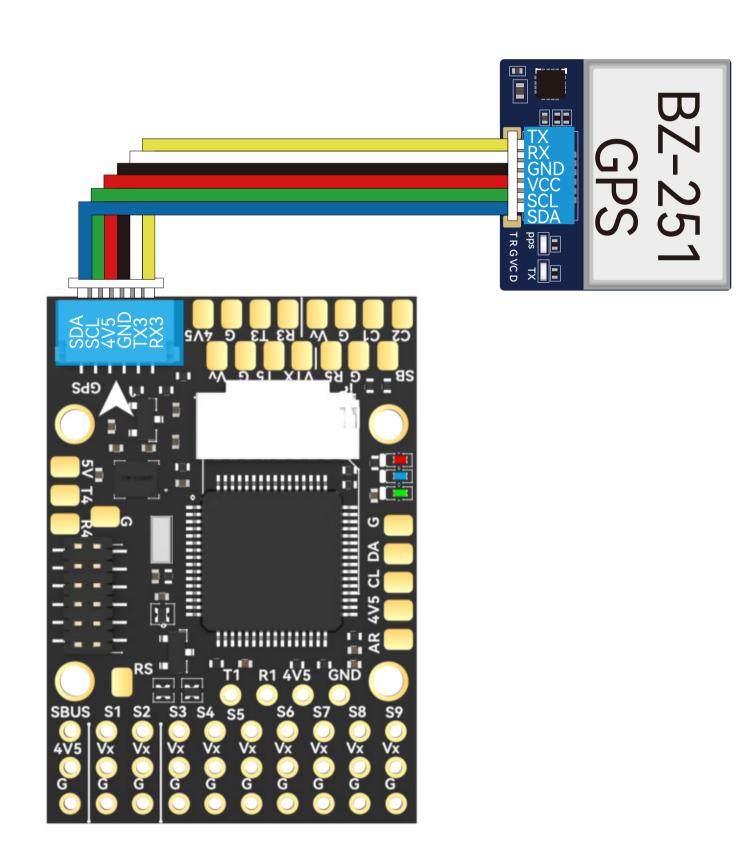

ArduPilot Settings

Detectable with default settings.

GPS Settings

Hardware Connection:

Rearrange the pre-crimped JST SH1.0 cables of the GPS Module Cable according to the GPS module's pin layout. Insert them into the 6-pin JST SH1.0 housing. The BZ-251 GPS module is recommended.

INAV SettingsIn the GPS tab, enable GPS for navigation and

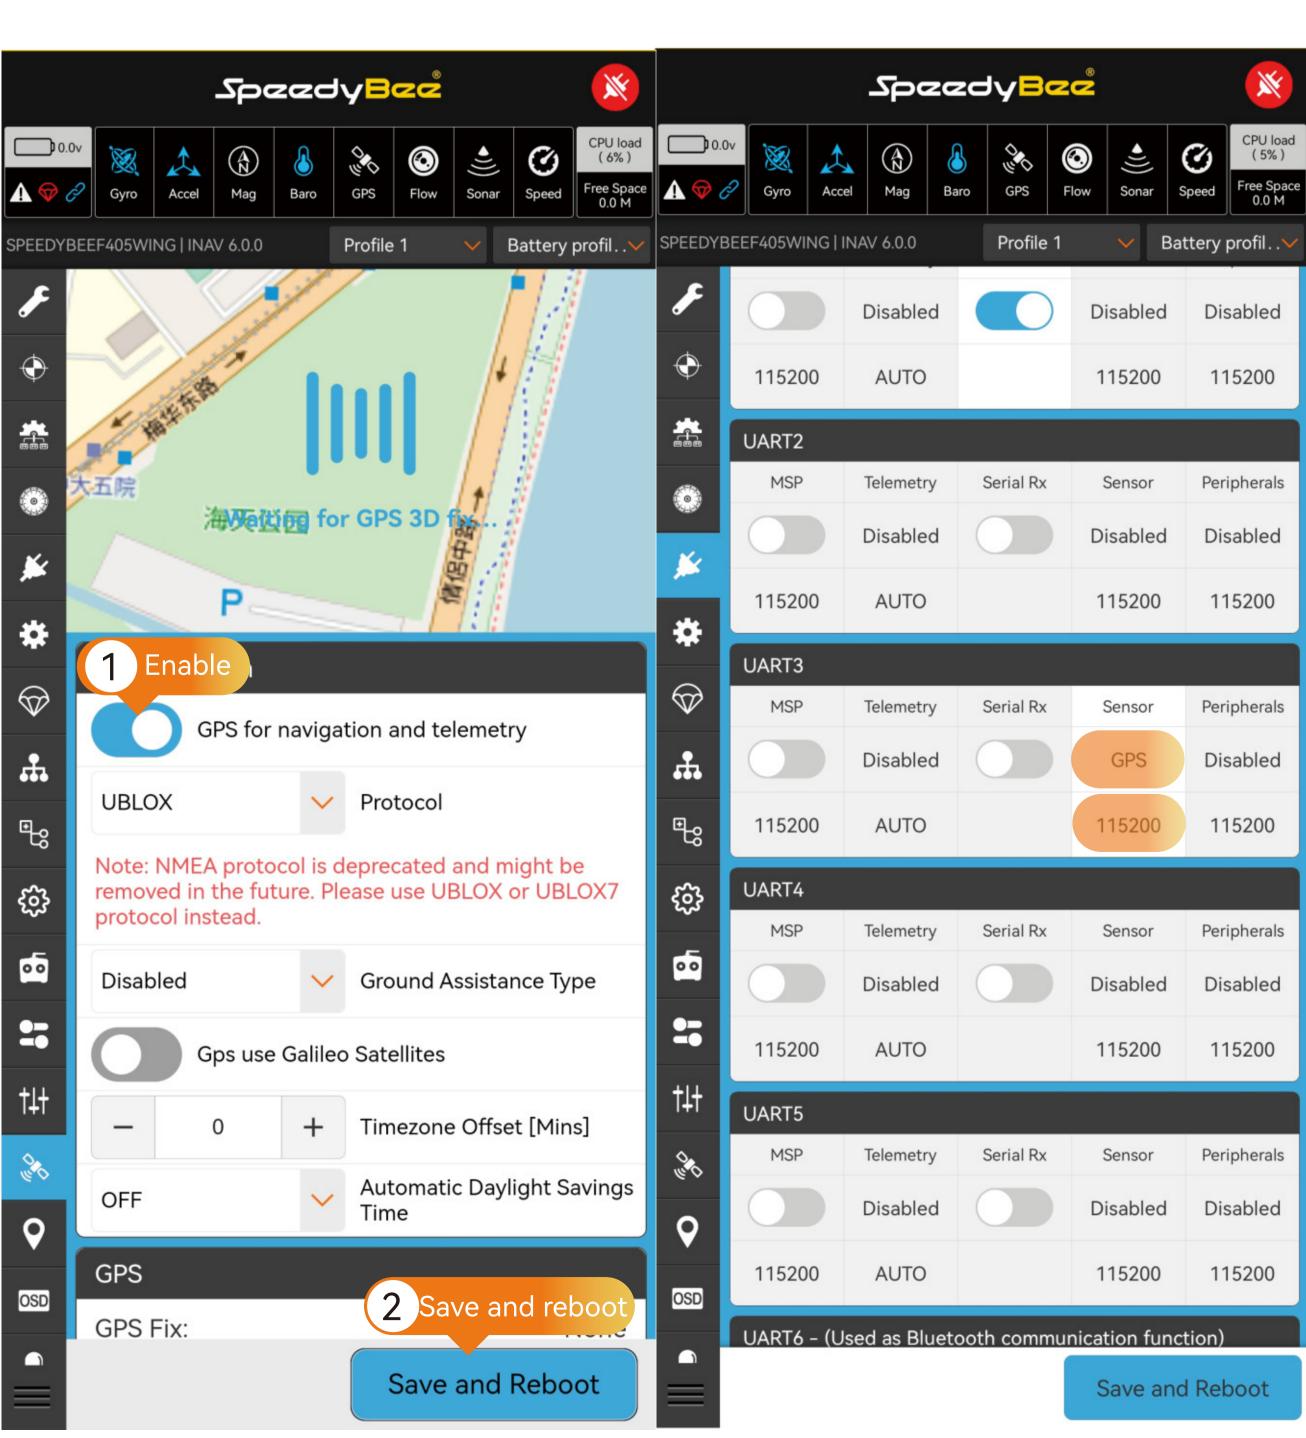

telemetry, then save and reboot. If not using a UBLOX module, refer to the specifications of the corresponding module and select the appropriate baud rate and protocol.

Supports two types of GPS protocols – UBLOX

ArduPilot Settings

and NMEA, with UBLOX protocol as the default. UBLOX M8N, M9, and M10 modules are automatically recognized.

INAV Settings

Compass (Magnetometer)Settings

Hardware Connection:

Use the recommended BZ-251 GPS module with an integrated QMC5883 compass. Install the GPS module away from the power supply lines, Motors, ESCs, and hatch magnets to avoid electromagnetic interference. Confirm the signal lines are connected as SDA to SDA, SCL to SCL.

INAV Settings

In the Configuration tab, select the appropriate compass option based on the compass model, then save and reboot. Adjust the compass orientation according to the specifications defined in the GPS module's documentation, then save and reboot.

ArduPilot Settings

Navigate to the Compass page in the SETUP of MissionPlanner and verify if the compass is correctly recognized. If the compass is properly identified, only enable the "USE Compass1" option. Onboard Mag Calibration: After securely installing the flight controller and GPS, calibrate the compass. Once calibration is successful, reboot the flight controller as prompted (No need to select compass model or set compass orientation).

SpacedyBac

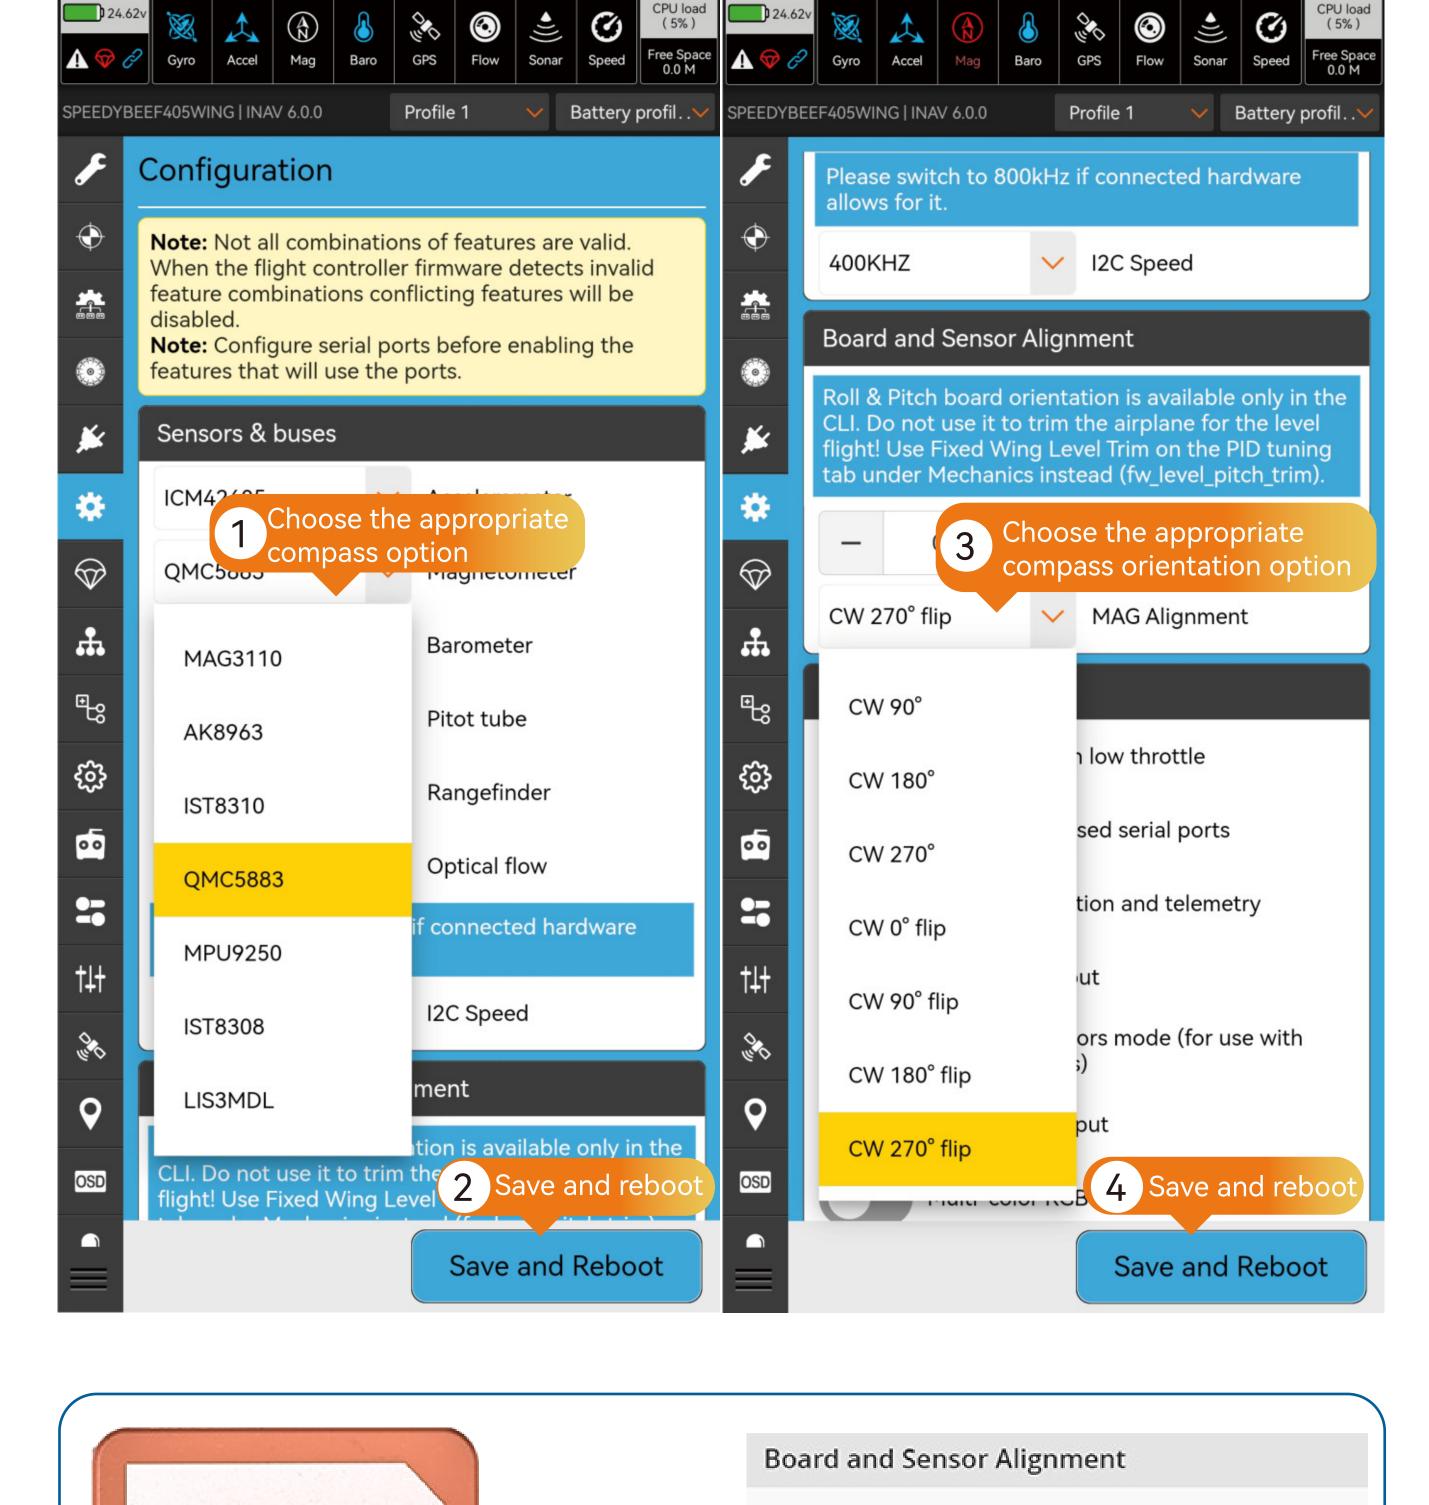

Roll & Pitch board orientation is available only in t

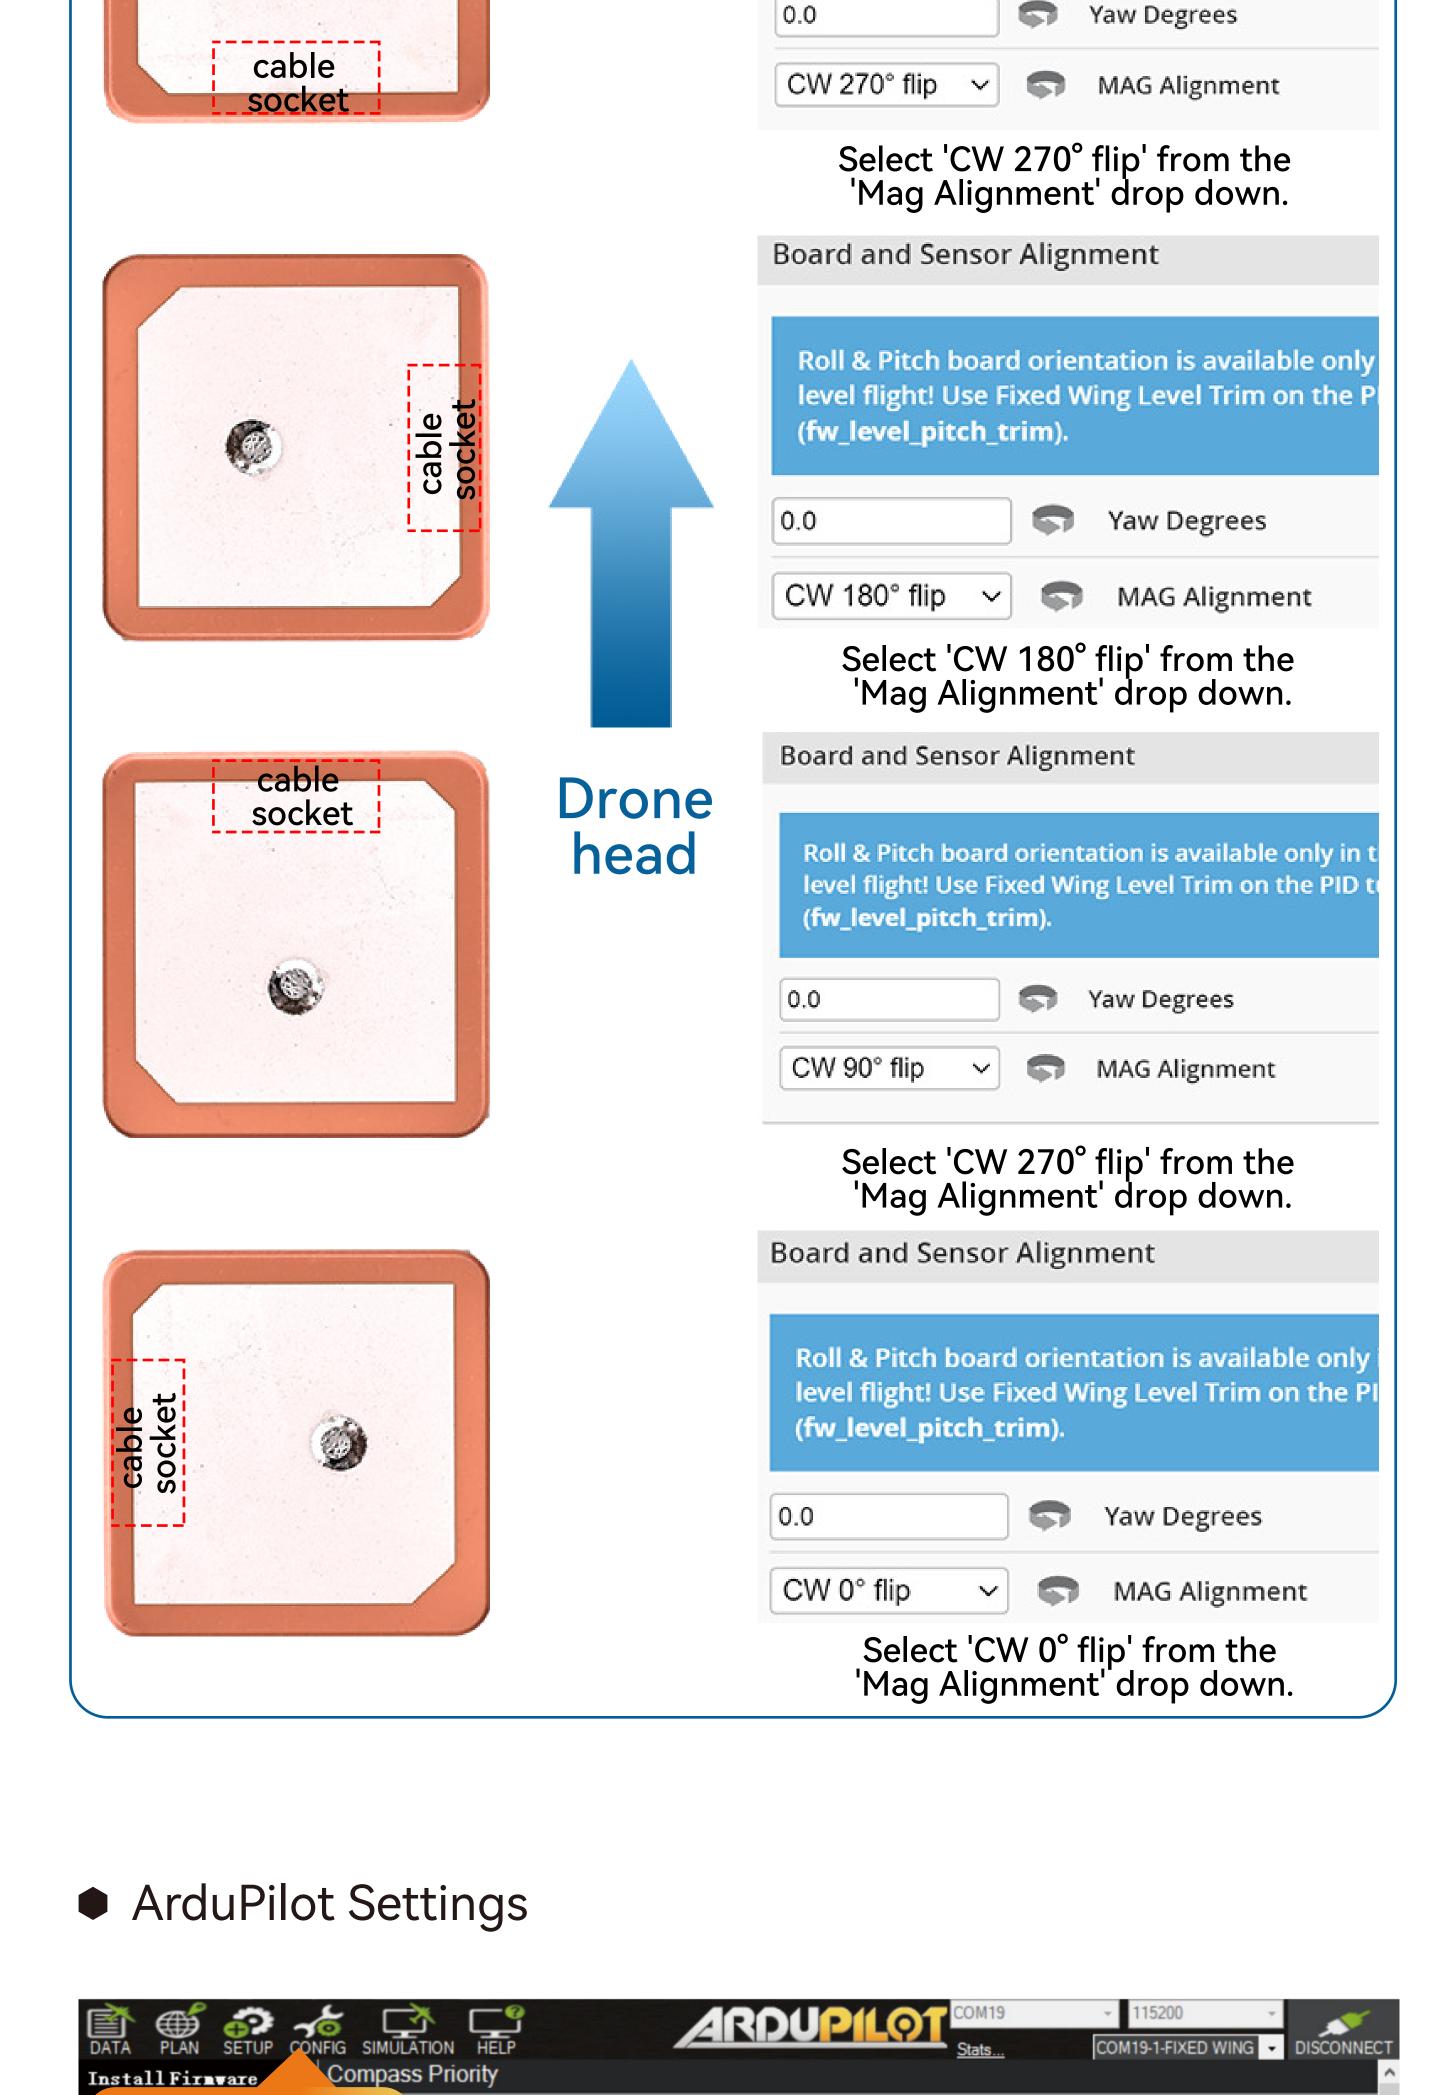

level flight! Use Fixed Wing Level Trim on the PID t

(fw_level_pitch_trim).
